Decision Models: Downloadable Weights and Image Support

Prepared 22 October 2026. This document preserves the previous answer's model lists and recommendations. "Not found" means image support was not confirmed in the sources reviewed; it does not prove the capability is impossible.

1. Models with downloadable weights confirmed

These were identified as having public model checkpoints or model-owner documentation indicating that weights are available.

Model	Weights available?	Image support?	Source
Laya	Yes	No — documented text-based model	Source
Laya Typed-Decisions	Yes	No — documented text-based model	Source
Laya Multilingual	Yes	No — documented text-based model	Source
Kev 0.8B	Yes	No — documented text-based model	Source
Kev 4B	Yes	No — documented text-based model	Source
Kev 9B	Yes	No — documented text-based model	Source
Kev 27B	Yes	No — documented text-based model	Source
Tev1-4B-experimental	Yes	Yes — image-text model card	Source
Clef	Yes	Yes	Source
Clef-flash	Yes	Yes	Source
Clef-omni	Yes, according to model registry	Yes; also listed for audio and video	Source
Liquid AI d1-3B	Yes	Yes — text + images	Source
Liquid AI d1-omni-600M	Yes	Yes; also supports audio input	Source
FRIDA-Decisions	Yes	Not found in its model documentation	Source

Note: "No" means the documented model is text-only, not that a separate multimodal system could never be built around it. "Not found" means image support could not be confirmed in the sources reviewed.

2. Models with both downloadable weights and image support

These are the models identified in the prior answer as having evidence for both downloadable weights and image input.

Model	Image support	Modality	Source
Liquid AI d1-3B	Confirmed	Text + images	Source
Tev1-4B-experimental	Confirmed by image-text model card	Text + images	Source
Clef	Confirmed	Text + images	Source
Clef-flash	Confirmed	Text + images	Source
Clef-omni	Listed as supported	Text + images + audio + video	Source
Liquid AI d1-omni-600M	Confirmed	Text + images OR text + audio	Source
Jev-Omni	Confirmed in listed sources	Text + images + audio + video	Source
Intern-Decision-0.8B	Confirmed	Text + images	Source
Intern-Decision-2B	Confirmed	Text + images	Source
Intern-Decision-4B	Confirmed	Text + images	Source
H2O-Lightning-4B	Confirmed	Text + images	Source
Surogate Rune 26B-A4B	Confirmed	Text + images	Source

3. Recommended starting points for on-device multimodal research

1. Liquid AI d1-3B — A good starting point for image-based decisions, with public weights and documented image support. Approximately 3.1 billion parameters. <link href='https://huggingface.co/LiquidAI/d1-3B' color='#155EEF'>Model weights</link>

2. Intern-Decision-0.8B — Worth investigating first if model size is a priority. Its model family supports image-conditioned structured decisions, and the 0.8B variant has public weights. <link href='https://huggingface.co/internlm/Intern-Decision-0.8B' color='#155EEF'>Model weights</link>

3. H2O-Lightning-4B — A downloadable decision model described as designed for structured decisions involving text and images. <link href='https://huggingface.co/h2oai/h2o-lightning-4b' color='#155EEF'>Model weights</link>

Important deployment distinction

Image support does not imply on-device NPU support. Before choosing a model, verify its quantized size, supported inference runtime, and whether it has actually been deployed on the target device or NPU.

Source links are included in the tables and recommendations. Modality and availability statements reflect the previous answer's source review and should be revalidated before deployment decisions.
